

First year courses

## **Master in Forensic Psychology**

Faculty of Psychology and Neuroscience

### **Psychotic Disorders**

#### **Full course description**

This course deals with disorders of processes involving perception and thinking. In films or books, psychotic characters usually display bizarre and unpredictable behaviours that people generally have difficulty identifying with. Therefore, most people feel rather uncomfortable around someone who is (or has been) diagnosed as suffering from a psychotic disorder. The aim of this course is to make psychotic disorders more understandable, more predictable, and less bizarre for students. It aims in particular to allow them to view such disorders within the context of experiences they are familiar with. In principle, anyone can become psychotic, but some people are more prone to becoming so than others, and in some people such disorders are more likely to become chronic. More specifically, students will develop an in depth knowledge of the relationship between psychotic disorders and violent behaviour. This knowledge will be gained through considering questions such as 'Can we argue that psychotic patients have an increased risk to become more violent? If so, does that relate to specific symptomatology, like hearing voices telling you to do certain things? And what about the possibility of feigning symptoms of a psychotic disorder?' Psychotic disorders will be discussed from a variety of theoretical perspectives. The so-called diathesis-stress model will be used as a guiding principle. How this diathesis/predisposition/vulnerability is defined and which characteristics are related to it depends on the theoretical perspective taken. An individual's presentation of psychotic symptoms can depend on a variety of conditions, such as the stress level experienced, ability to cope with stress, and protective factors such as availability of social support. During this course, it will become apparent that relatively little in the way of 'hard empirical facts' is known about psychoses in general and schizophrenia in particular. Another factor in present-day society, which is increasingly becoming more multicultural, is that psychoses can also have a different significance depending upon the cultural context. In this sense, this course will look at psychosis from a large number of theoretical perspectives, and students will be expected to delve into the various theories whilst developing an understanding of their strengths and limitations.

#### **Course objectives**

Knowledge of: Diagnostics (DSM-IV), diagnostic instruments, clinical picture and differential diagnosis, neurobiological and psychosocial etiological models and treatment, relationship between violence and psychosis, aetiology of violence, command hallucinations, detection of feigned hallucinations and delusions, cultural aspects.

#### **Recommended reading**

## Personality Disorders

### Full course description

This course deals with one of the biggest problems in forensic mental health: personality disorders (PDs). PDs are found in approximately 10% of the adult population and approximately 50%-80% of the forensic psychiatric and prison population. They are mental disorders defined by chronic, maladaptive personality traits that cause dysfunctional behaviour. In the forensic field, this behaviour includes aggression and criminality. The most prevalent PDs in forensic populations are Antisocial, Borderline, and Narcissistic PDs, although the entire range of DSM-V PDs are represented. Within the forensic field, the most attention has been given to so-called Psychopaths, which is the most severe subgroup of patients with Antisocial PD. People with PDs consider their personality traits to be normal (i.e., "ego syntonic"), although they may perceive some of the effects of the disorder as undesirable. Consequently, there is often no clear request for help. At times, clients only start treatment under pressure or force (i.e., by order of the law). PDs can only be diagnosed in adulthood, at age 18, because before that, personality has not yet sufficiently consolidated. However, in many patients, chronic patterns of antisocial behaviour are often evident by adolescence or even earlier. Historically, PDs have always had a negative connotation. People suffering from these disorders are generally perceived as untreatable, though there is little solid evidence to support this view. Recently, a number of treatments for PDs have been developed which show good evidence of effectiveness, including some promising approaches for forensic patients with PDs. In this course, we consider PDs from a theoretical, research, and treatment perspective with particular attention to the forensic field.

### Course objectives

Knowledge of: Diagnostic/clinical description of PDs, particularly as they appear in forensic settings; the connection between PDs, crime, and violence; the development of PDs; the cognitive and

## Master Forensic Psychology

neurobiological bases of PDs; and the treatment alternatives for PDs. Skills: execute diagnostic personality disorder interviews; diagnose personality disorders; relate to patients during interviewing.

## **Criminal Law**

### **Full course description**

Since forensic psychology is the application of the science and the profession of psychology to questions and issues relating to criminal law and the criminal justice system, it stands to reason that a course in criminal law forms a substantial part of this master's programme. Knowledge of the principles and concepts of criminal law and criminal procedure, private law and the position of children and juveniles in the legal system could strengthen an individual's position as an expert witness in court. This eight-week course will combine seven sessions of group tutorials and six lectures. The first week of this course will focus on an examination of different criteria for criminalisation, and the ruling principles of criminal law. The second week of the course will focus on the elements or constituents of a criminal offence: The actus reus; the objective or external elements of a crime, and the mens rea; the subjective or mental element. In the following two weeks, the main focus of the course will be on the rules of criminal procedure, since it is only through these procedural rules that the substantive criminal law can be applied in a specific case. A distinction will be made between the pre-trial rules and the procedural rules during a trial. During week five, the central theme is the special position of children and juveniles in the legal system. Since the expertise of forensic psychologists is also sought in private cases regarding (e.g.) wardship, parenthood, or proving damage after an accident (often PTSD or whiplash), a brief overview of civil procedure and private law will be given in the sixth week. Week seven will focus on measures and punishment and

the position of victims.

## Course objectives

Knowledge of: Substantive criminal law, criminal procedure, civil law, common law, law, treaty, jurisprudence, mens rea, actus reus, intention, negligence, offenses, defenses, justifications, excuses, human rights, (rights of) the suspect, reasonable suspicion, Salduz, Miranda warning, criminal liability, acquittal, discharge, sentence, punishment, measure, private law, civil procedure, tort.

## Sex Offenders

### Full course description

This course deals with the psychology of sex offenders. The offensive behaviour of sex offenders causes major harm to their victims. Their harmful behaviour also results in considerable distress in society. Although the occurrence of sexually offensive behaviour in the community is low, the

## Master Forensic Psychology

severity of the sequelae of sex offending behaviour justifies the development of a specialised course in which the psychological and biological mechanisms and disorders underlying this delinquent behaviour are studied. Moreover, the field of forensic psychiatry has a growing need for psychologists who are knowledgeable and trained in the field of assessment and treatment of sex offenders. Main topics in this course include theoretical models of the aetiology of sexual offending, risk assessment, the assessment of psychological characteristics specific for sex offenders (e.g., paraphilic sexual arousal, cognitive distortions), specific types of sex offenders (e.g., female offenders, exhibitionists, rapists, etc.) and types of offending (e.g., cross-over offending, online offending, etc.), and treatment of sex offenders (treatment methods and outcome research).

### Course objectives

Knowledge of: The phenomenology of sexual offenses, the phenomenology of sex offenders, diagnostic instruments for paraphilic sexual arousal, theoretical models of sexual offending, theoretical knowledge about risk assessment, information about victims' memory for sexual offences.

### Recommended reading

Marshall, W. L., Marshall, L. E., Serran, G. A. & Fernandez, Y. M. (Eds.) (2006). Treating sexual offenders: An integral approach. New York: Routledge; Thornton, D., & Laws, D. R. (Eds.) (2008). ## Young Offenders

### Full course description

This course will address different approaches to treatment of young offenders. The limited effectiveness of treatment of adult offenders has pointed to the need for preventive interventions

## Master Forensic Psychology

with children and adolescents. In this course, students will first be exposed to recent advances in the study of predictors and causes of antisocial behaviour in children. The specific role of neuropsychiatric disorders and family dysfunctioning will be addressed. Subsequently, students will learn about effective interventions used for elementary school age children, such as Parent Management Training Oregon (PMTO) and Stop-Now-And-Plan. Following this, the course will focus on evidence-based treatment programmes for adolescent offenders, such as Functional Family Therapy and MultiSystemic Therapy. Finally, attention will be paid to interventions that have been shown not to work, as well as the negative effects of institutional treatment. Myths about juvenile delinquency will also be discussed. In this four-week course, students will be exposed to a number of different theoretical and interventionist approaches in the area of juvenile offending. A key element will be the What Works approach: interventions that work have a strong theoretical rationale, focus on the relevant risk factors for offending, use routine quality monitoring to prevent programme drift, and are continually evaluated in terms of effectiveness. The relevance of different risk factors, such as neuropsychiatric disorders in the child (e.g., ADHD, autism-spectrum disorders, psychopathy), parental factors (mental disorders, poor parenting skills) and environmental factors (poverty, cultural aspects), will be illustrated. The lectures in this course will be delivered in part by experts from the juvenile justice field. Furthermore, the course will be supplemented with a workshop on using risk assessment tools like SAVRY and EARL.

### Course objectives

Knowledge of: Theories of delinquent behaviour, evidence-based treatment interventions for children, quality control and treatment integrity, risk assessment in young children and adolescents, evidence-based treatment interventions for adolescents, treatment of young institutionalised offenders, iatrogenic effects, effective institutional treatment, risk assessment in adolescent offenders, myths on child delinquent behaviour, myths about adolescent delinquent behaviour.

# Assessment Skills Lab I

## Full course description

Forensic psychological assessment differs in a number of important respects from that of psychological assessment (which occurs in a general clinical context). First of all, subjects are required to undergo a mental health assessment at the request of the court, which may adversely affect their willingness to participate and lead to distorted response styles. By contrast, in most other assessment contexts, the subject is seeking help and is open to discuss his/her problems with the assessor. Secondly, the forensic psychologist is asked to answer questions that are posed by the court, which requires the psychologist to 'translate' legal professionals questions into questions that a psychologist can answer. And finally, the forensic psychologist needs to be able to administer, code, and interpret specific forensic assessment instruments, relevant to the type of legal questions asked. Among these, the question of psychopathy is highly prominent. Forensic psychological assessment is a highly specialised form of psychological assessment. Questions posed to the assessment psychologist by the court are very different from the common questions in other fields of psychology. Examples include: Is there a relationship between the mental disorder of this subject and his behaviour at the crime scene? What is the risk of future re-offending in this arsonist? Should this sex-offender be allowed back into the community? The answers to these types of questions are never immediately at hand and require extensive knowledge of offender typologies, base rates of recidivism of different offender types, relationships between different mental disorder symptoms and offending behaviours, and extensive psychological assessment, employing the relevant forensic assessment tools. Students will receive specialised training in two essential forensic assessment instruments: the Psychopathy CheckList-Revised and the PCL: Youth Version. They will also learn how to write up the results of these assessments in a structured and transparent way in order to inform the court.

## Course objectives

Knowledge and skills with regard to: Specific requirements of personality assessment in a forensic context (e.g., multimethod assessment; the importance of collateral information; conducting a biographical interview with a forensic patient; use of semi-structured methods, founding of diagnostic conclusions in evidential facts); psychopathy assessment, i.e., students will be able to code the Psychopathy Check List-Revised and Psychopathy Checklist: Youth Version on the basis of a videotaped semi-structured interview and file information, and ability to write a structured report on it.

## Assessment Skills Lab II

### Full course description

The purpose of this course is to help students acquire a number of specialised and complex forensic psychological assessment skills. This course builds on and is a sequel to Assessment Skills Lab I. During seven full-day workshops, students will receive state-of-the-art training in two main areas; criminal responsibility and violence risk assessment. As in course PSY4621, forensic psychological assessment is shown in contrast to psychological assessment (which takes place in a general clinical context). Students will receive specialised training in two essential forensic assessment instruments: the RCRAS and the HCR-20. Furthermore, they will receive basic training in the use of a number of general psychological assessment instruments within a forensic context, such as the MMPI-2. They will also learn how to write up the results of these assessments in a structured and transparent way resulting in a report to the court.

### Course objectives

Knowledge of: Assessment of criminal responsibility, personality assessment in forensic context, assessment of risk of future violence, writing forensic reports.

## Professional Ethics

### Full course description

In forensic psychiatric practice, forensic psychologists are involved in diagnostic assessments, court reporting and clinical treatment of mentally ill offenders (or suspects). In this practice, a variety of ethical tensions and problems arise. During this course you will get to know the most salient ethical issues for forensic psychologists and get acquainted with what may be called 'the ethical stance', that is you will learn to reflect on these issues. Moreover, this course will show you how ethical issues and questions differ from science and scientific questions and how professional ethics can contribute to careful and responsible practices. To this end, we will focus on four different issues. 1. In the last years, criminal responsibility has been controversially discussed. This does not only hold for suspects who suffer from a psychological or psychiatric condition, but also in general it has been doubted that people could ever be held responsible for their deeds. Increasing evidence about the genomic and neurobiological underpinnings of human behavior, have prompted some to conclude that free will would be an illusion and that therefore holding each other responsible would be awkward. We will critically discuss the meaning of free will and responsibility and try to figure out when and for which reasons these concepts remain sensible. 2. The practice of a forensic psychologist is characterized by the so- called double role. One role is connected to the state and involves the fact that the relationship with the client is not based on a free agreement, but is initiated by the state and connected to the process of criminal justice. This is the professional's role as an agent of the state. The second role is given by the professional obligation to do good for the patient/client. This is the therapeutic role. In practice, these two roles might conflict and corresponding ethical dilemmas might emerge. For example: How to deal with confidentiality, privacy and secrecy, central elements in doctor-patient relationships, if one -also- has to report to the court? In this course you will get to know the dilemmas connected to these 'two-hats' and discuss how to properly deal with them. 3. During his or her stay in forensic psychological institution, a patient may be subjected to coercive interventions. Compulsory treatments or measures might be applied. In this course you will critically discuss and reflect on the use of coercion in forensic psychological practice. Ethical aspects that are crucial in this regard are the requirement to respect the bodily and mental integrity of the individual at stake, harm to or the safety of the patient him- or herself, as well as harm to others and public safety issues. 4. As a professional you may also get involved in scientific research in which forensic patients may serve as research participants. Scientists have to adhere to certain, well-defined research ethical

requirements, with informed consent as its cornerstone. Given the involuntary character of the situation of forensic patients, specific questions arise, which will be discussed in this class.

## Course objectives

Knowledge of: Professional ethics of forensic psychology, criminal responsibility in relation to behavioural genetics and neuro-imaging, privacy and confidentiality, ethical dilemmas in forensic psychology, professional- patient/client relationship, coercion and pressure in forensic care, forensic research ethics.

## Forensic Neuropsychology

### Full course description

Criminal courts are becoming increasingly aware of the unique and important contribution neuropsychological assessment may have to mental health evaluations in forensic practice. This pertains especially to cases with specific central nervous system pathology. As a result, neuropsychological expertise is requested in a substantial number of criminal and civil cases. Evidence suggests that traumatic brain injury is highly prevalent in individuals in forensic settings. The use of high-tech brain imaging techniques in defendants and forensic patients, to explain or underscore specific theories on brain-behaviour relationships, is becoming increasingly common nowadays. But what is the value of such brain images in individual defendants? Given the increased demand for experts in forensic neuropsychology, it is desirable for forensic psychologists to have expertise in this particular field. Defendants in criminal cases, increasingly state that they do not

## Master Forensic Psychology

have any memory for their offence. This raises the question of whether this is always a valid defence. Besides this, defendants and witnesses with traumatic brain injury and/or functional or neurodegenerative disorders are becoming more common in legal settings. It is often assumed that these persons can, as a witness or as a defendant, give accurate statements. In search for answers on the validity and credibility of these issues, forensic psychologists should have state-of-the-art knowledge of clinical neuropsychology, neuropsychological assessment, neuropsychology of memory, and neurological vulnerability.

### **Course objectives**

Knowledge of: Brain structure and function, neurological disorders, confabulation, amnesia, violence, structural brain scans in court, functional brain scans in court, neuropsychological assessment (psychometrics and psychodiagnostics), aggressive behaviour, mental retardation.

## **Forensic Assessment in Child Custody and Child Abuse Cases**

### **Full course description**

Forensic assessment in child custody and child abuse cases (CCA) is the most complex form of assessment a forensic psychologist can be asked to conduct. This type of assessment requires extensive knowledge of child development, child and adult psychopathology, family dynamics and the causes and consequences of trauma. During this course, students will be exposed to best-

evidence standards for CCA and will examine real-life CCA forensic evaluations in light of these best-evidence standards and the latest empirical research.

## Course objectives

Gaining knowledge of: International guidelines for forensic evaluations in child custody/child protection cases ('best interests of the child'- doctrine); forensic assessment tools used for parenting capacity assessment, work product review method of forensic evaluations in CCA. Special attention will be given to impartiality and objectivity in order to serve the best interests of the child.

## Applied Statistics for Forensic Psychologists

### Full course description

The course consists of six units. The first unit will focus on a review of multiple linear and logistic regression analysis, which will form the basis for most of the advanced techniques that will be covered in the remainder of this course. This general introduction into regression techniques is followed by a unit that focuses on ROC curve analysis. ROC curves are becoming increasingly more important to forensic psychologists, for instance, to help find optimal cut-off scores for instruments that should help decide on whether an institutionalized offender can be granted parole or leave, or for studying whether verbal veracity assessment tools can discriminate between truth or falsehood of incriminating or exculpatory statements. In studies on the accuracy of identification of crime suspects, a comparison of ROC curves can be used to decide which of several line-up procedures is superior in terms of maximizing correct and minimizing false identification rates. The next three units are devoted to mixed (multilevel) regression for nested designs and longitudinal studies. This mixed regression starts with a unit on marginal models for repeated measures (for instance, a time series of observations on institutionalized offenders receiving specialized treatment). Especially in

## Master Forensic Psychology

cases of missing data or within- subject covariates, such models are known to be more efficient than traditional techniques such as repeated measures ANOVA. In this first of three units on multilevel regression, students are shown the pros and cons of various models for the correlational structure of repeated measures, such as compound symmetry and AR1. The second unit covers the random intercept model for repeated measures as a method to include individual effects in marginal models for longitudinal data (growth curves) or single trial analyses of lab data. Students learn how this can be combined with e.g. ARMA modelling to distinguish between interpersonal and intrapersonal outcome variation. The random intercept model will also be applied to a cluster randomised trial - i.e. an RCT where organisations, like institutions treating justice-involved adolescents, are randomised. The third and last unit on mixed regression covers random slope models for longitudinal data (individual differences in change over time), single trial analysis (individual differences in stimulus effects) and multicentre trials (RCT within each of a number of organisations). Finally, the topic of meta-analysis is covered in the sixth unit.

### Course objectives

Knowledge of: Multiple linear and logistic regression; ROC curve analysis; Mixed (multilevel) linear regression with random effects and autocorrelation; Meta-analysis.

### Prerequisites

Good understanding of descriptive and inferential statistics at the elementary and intermediate level, including multiple linear regression. Skilled in the use of SPSS for statistical data analyses.

### Recommended reading

Lecture handouts and a suitable book chapter or article per unit.

## Research Proposal

### Full course description

In the second year of the Forensic Psychology Master programme, students are expected to conduct a research internship. The research undertaken for a master's thesis will offer students opportunities for critical reflection and problem solving. The research must be empirical (either quantitative or qualitative), and will preferably involve students in all phases of the empirical cycle. The master's thesis will be written in the format of an empirical article, including Introduction, Method, Results and Discussion. Students start their internship with the writing of a research proposal.

### Course objectives

Knowledge of: How to formulate research question, search for literature, design an experiment, collect data, data analysis, write master's thesis.

### Prerequisites

Completion of all first year Forensic Psychology courses.

### Recommended reading

Search for relevant literature.

Teaching methods:

Research, Skills

Assessment methods:

Final paper, Observation, Participation

Keywords:

Research, design, data collection, analysis, master's thesis, research proposal.

Faculty of Psychology and Neuroscience

## Research Internship Graded

### Full course description

In the second year of the Forensic Psychology Master programme, students are expected to conduct a research internship.

The research undertaken for a master's thesis will offer students opportunities for critical reflection and problem solving. The research must be empirical (either quantitative or qualitative), and will preferably involve students in all phases of the empirical cycle. The master's thesis will be written in the format of an empirical article, including Introduction, Method, Results and Discussion. Students start their internship with the writing of a research proposal.

### Course objectives

Knowledge of: How to formulate research question, search for literature, design an experiment, collect data, data analysis, write master's thesis.

### Prerequisites

Completion of all first year Forensic Psychology courses.

### Recommended reading

Search for relevant literature.

## **Clinical Internship**

Faculty of Psychology and Neuroscience

## **Clinical Activities Report**

### **Full course description**

Students specialising in Forensic Psychology are required to conduct a clinical internship in an approved setting. The clinical internship can be conducted in conjunction with the research internship or separately. Students are required to submit a report on their experiences during the clinical internship. Requirements for this report are provided to students via EleUM. Students commence their internship by writing a description of their learning goals. This clinical internship lasts a minimum of 5 months. In addition to the clinical internship, students may want to acquire a qualification in Psychodiagnostics ("NIP Basisaantekening Psychodagnostiek"). The Master's in Forensic Psychology will also allow graduates from the programme to meet the entry demands of the post-master's education as a Health Care Psychologist ('GZ-psycholoog').

### **Course objectives**

Knowledge of: Applying scientific knowledge to forensic practice, reflection on performance of clinical skills, forensic assessment, forensic treatment and risk management.

### **Prerequisites**

Completion of all first year Forensic Psychology courses.
